

# Revolabs Single and Dual Channel Wireless Microphone Systems

## High Definition Available in Single and Dual Channel Systems

### Wideband Frequency Response

The Revolabs HD™ Single and Dual Wireless Microphone Systems have high definition audio, 50 Hz to 20kHz, which allows the systems to pick up the entire human voice spectrum. These Systems utilize the Revolabs Designed for Speech (DFS20™) technology in a very small form factor.

Single and Dual HD Base Station

### True Plug and Play

The Single and Dual Channel HD Systems provide some audio processing EQ and mixing capability, eliminating the need for external DSP audio processing equipment in many cases. Each System ships with a Charger Base (one or two microphone charging docks) and a Base Station.

### Flexible

The HD Single Channel System has a balanced analog input and output, and the HD Dual Channel System has two of each, plus the ability to mix both outputs into one. All outputs can be line or mic level. This provides maximum flexibility to use the HD Single/Dual Channel System wherever a wired microphone can be used, making the system perfect for video-conferencing, voice lift and PA applications.

All HD Wireless Microphones, Wearable, Omni, Directional, and Adapters for Dynamic and Countryman Microphones work with the HD Single and Dual Channel Systems and can be mix and matched.

Dual HD Charger Base

Single HD Charger Base

The Single and Dual Channel Systems are not upgradeable or expandable. For up to 32 microphones, use the Executive HD 4 or 8 Channel Systems.
